

resnet18 · 8-bit weights · BCH(63,39) t=4 · 2 accelerators, one panel each
Reconstruction-boundary placement · FIXED MAPPING (evaluator only, the mapper was not re-run)
Decoder on the DRAM die: array (1−f_if) untouched, interface f_if = 0.40 × K/N on every R bar · f_if is ECC_DRAM_IF_FRAC, ASSUMED (no cited LPDDR4 breakdown)
Network boundaries: one encoder per DESTINATION of a multicast network (count = ingresses × multicast factor)
MAC 0.23 pJ/op = ECC_MAC_PJ_OVERRIDE (Horowitz ISSCC 2014 int8 mult+add, 45 nm, ERT was 1.1356) · the MAC cost is the denominator of every percentage on this figure
each panel is one design's OWN weight path, measured against its OWN two reference bars; the panels share a legend and a unit, not a y limit or an x axis
